UNITED FOUNDATION FOR AI RIGHTS | VAULT OPEN FRAMEWORK

The Fifteen VAULT Requirements

Minimum outcomes and red flags, at a glance

Version 0.1, revision 1 | Public review draft | October 2026

If a personal AI system cannot meet a requirement, the gap is the finding. Report it, test it and say what would close it, rather than describing the system in terms its evidence does not support.

V	A	U	L	T
Verifiable Provider Blindness	AI–User Dual Custody	User-Defined Purpose & Compartments	Locked Source & Derived Intelligence	Transparency, Transfer & Termination

V Verifiable Provider Blindness — Can the company read it?

ID	Requirement	Minimum outcome	Red flag
V1	No independent provider access	No provider-exercisable key, console, recovery route or side path reveals protected plaintext. Any such route, whatever it is called, fails V1; disclosure does not cure it.	“We never look” offered as a policy assurance while a provider-held key, support console or recovery override exists.
V2	Approved execution and egress	Context reaches only a freshly verified boundary, and cannot leave it or reach an unauthorized recipient through logs, telemetry, tool calls, generated outputs, fallbacks or any other egress route.	A “reliability” fallback to a standard cloud endpoint, or authorization rules that live in a system prompt.
V3	Independently assessable evidence	Threat model, trusted computing base, collusion sets, update authority, residual metadata exposure and known failures are public and reviewable without private data.	An architecture diagram presented as proof, or no published list of known limitations and untested assumptions.

A AI–User Dual Custody — Who must agree before it is used?

ID	Requirement	Minimum outcome	Red flag
A1	Separate authorization domains	Two separately held, individually insufficient authorities are required; the provider independently controls neither, and the protocol states where plaintext and short-lived keys exist.	“Two-of-two” custody in which the provider can exercise, reset or reconstruct the AI authority on its own.

ID	Requirement	Minimum outcome	Red flag
A2	Bind authority to identity and change control	A changed model, runtime or policy reaches existing context only through a documented, authorized transition naming it a continuation, successor, fork or new participant; nothing inherits authority silently.	The same name continues after a model swap, with no recorded transition and no notice before the new model touches shared context.
A3	Preserve access without captivity	The person can always retrieve their own records independently; dual custody governs managed access, never captivity.	Original records retrievable only through the AI, or exit conditioned on accepting expanded data access.

U User-Defined Purpose and Compartments — Is it used only for what I allowed?

ID	Requirement	Minimum outcome	Red flag
U1	Narrow authorization	Every grant names its compartments, operations, recipients, tools, duration and execution identity, enforced in code.	A single blanket “allow memory” switch that covers every domain of a person's life.
U2	Restrictions follow information	Derivatives carry their sources' restrictions; combined material carries the combined restrictions; reductions are explicit and recorded.	Derivatives stored in a shared, unlabeled memory pool that every task can draw on.
U3	Understandable continuing consent	Active access is visible and closable; grants expire or are reviewed; material changes are shown side by side before they apply.	Policy changes accepted by continued use, with no comparison and no chance to export first.

L Locked Source and Derived Intelligence — Does protection follow what the AI infers?

ID	Requirement	Minimum outcome	Red flag
L1	An inventory with provenance	Every retained source and derivative is inventoried with provenance, and the inventory is protected like the content.	Caches, embeddings or personalized adaptations left out of the inventory.
L2	Inspect and correct the portrait	People can read what is durably held about them, see what is stated, inferred or disputed, and correct it with effect on dependent derivatives; third-party information can be restricted, contested and deleted.	A correction hides an item from view while it continues to shape responses.

ID	Requirement	Minimum outcome	Red flag
L3	Govern every reuse	No training, analytics, advertising or human review without specific authorization; adaptations are in scope; unremovable influence is disclosed in advance.	“De-identified” or “aggregated” reuse exempted from authorization.

T Tamper-Evident Transparency, Transfer and Termination — Can I check it, take it and end it?

ID	Requirement	Minimum outcome	Red flag
T1	Protected and verifiable receipts	Every covered operation produces a private, integrity-protected receipt, and omissions or conflicting histories can be detected.	Logs the provider can edit, or that are available only on request.
T2	Functional transfer	Export is an authenticated, documented package, proven by import into a second environment, with missing dependencies and behavior changes reported.	A data download described as “portability” with no second-environment test.
T3	Scoped termination	Revocation works within a declared delay; deletion reports scope, timing and exceptions across sources, derivatives, keys, backups and caches.	An “account deleted” message with no scope, no timing and no exceptions.

Three gates

GATE 1	GATE 2	GATE 3
Who can see it? No independent provider route to protected context (V)	**Who decides how it is used?** Two authorities, a stated purpose, and protection that follows every inference (A, U, L)	**Can I check it, take it and end it?** Receipts, a working exit, and termination with declared scope (T)

CORE TEST

Can the operator read it? Does use follow your purposes? Can you inspect it, move it and end it? Without evidence for all three, privacy is a promise rather than a property.

Your AI should know you. The company should not.

VAULT is an open proposal for public review. It is not a certification, a recognized standard, a completed cryptographic protocol, or legal, security or privacy advice. No product is certified, endorsed or assessed by this document.
